

# ANNUAL DRINKING WATER QUALITY REPORT

## 2021 RESULTS

SUGARLOAF WATER SYSTEM

PWS ID: 463168

# VISION OF TOMORROW, ACTION TODAY

Dear Valued Customer,

I am very proud of how District staff have maintained our high standards of care during the ongoing pandemic. COVID-19 has caused many impacts to our community, but working collaboratively, District staff ensured our drinking water remained safe 24/7/365.

The District has not just stood by this past year and rested on our past accomplishments. We have continued to actively contain costs, pursue grant funding for our tank replacement projects and assisted Tacoma Water secure a "\$220M down payment" for Howard Hansen Dam downstream fish passage while investing in our infrastructure to meet and/or exceed our level of service goals.

One major outcome is we did not raise residential rates for the 6th straight year.

Other efforts included:

**Financials** – While COVID did impact several hundred District customers, there were no tangible financial impacts to the District's bottom line because of COVID due to containing expenses and having very strong water sales. 2021 Budgeted expenses were \$2.2M under budget. SAO completed their annual audit and happy to report the District passed with no findings. The District's debt to equity ratio which hovered around 50% in 2015 is now down to approximately 27%

**Infrastructure**- The District has completed the rehab improvements to the Witte Well Treatment Plant along with construction of the Pebble Creek Crossing that required extensive coordination with BNSF and BPA. The 148th Avenue Extension is ready to be bid, while the Tank 1 and Tank 4 projects have substantially completed designs and are awaiting permit approval. The District is also pursuing \$2M in grant funding for each tank.

**Operations** - The District worked with Tacoma and our Partners to complete the GRFF Manganese Study and get Tacoma to focus on the cleaning of P5 later this year to remove built up manganese as well as consider treatment technique changes at GRFF. The District's overall water quality met or exceeded DOH's SDWA requirements, staff continued to proactively reach out to schools and commercial customers to provide guidance on possible Legionella contamination due to inactive use and we are happy to report that our water supply sources are not exposed to any sources of PFOS/PFOA like some utilities in the area.

I hope that your family and friends remain safe and healthy during this difficult time in our world's history.

Sincerely,

A handwritten signature in blue ink, appearing to read 'T. Keown', with a long horizontal flourish extending to the right.

Thomas Keown, P.E.  
General Manager  
Covington Water District

Because doing the right thing is crucial when it comes to our future's water quality.

# SAFE & RELIABLE DRINKING WATER

Covington Water District is committed to providing our consumers with safe, reliable drinking water.

Our goal is to continue improving our product by implementing cost effective measures such as source and distribution system improvements that enhance reliability and produce a level of water quality that exceeds federal and state drinking water standards.

This commitment to safe and reliable drinking water combined with the investments into source and infrastructure improvements will have lasting benefits for current and future generations.

Please take time to review this report and join us in appreciating the vital role water plays in all of our lives.

# RELIABLE SERVICE AND COMMITMENT TO YOU

Covington Water District (CWD) is proud to present your annual Water Quality Report. This edition summarizes the results of the water quality testing completed from January through December of 2021. The results contained in this report show Covington Water District is providing safe potable water that meets or exceeds federal and state regulatory agency requirements. We hope the contents of this report are useful and informative.

Sugarloaf Water System's drinking water comes from one ground water source owned and operated by Covington Water District.

## Protecting Public Health is our Number One Priority

Covington Water District's Operations employees strive to protect public health through extensive water quality testing. Twice a month, CWD's Water Treatment Operator collects a water sample in the water distribution

system looking for coliform bacteria. If there is a presence of coliform bacteria in drinking water, this indicates that disease-causing organisms (pathogens) could be in the water system. Samples are submitted to an independent certified laboratory for analysis and those results are submitted to the Washington State Department of Health Office of Drinking Water.

If you have any questions or concerns regarding the information contained in this report, please contact Glenn Stockman, Water Quality Lead at 253-867-0944 or [glenn.stockman@covingtonwater.com](mailto:glenn.stockman@covingtonwater.com).

We work to provide clean water so you don't have to worry about it.

# IMPORTANT INFORMATION FOR YOUR HEALTH

## Important Information for Your Health

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA's Safe Drinking Water Hotline, (1-800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons, such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, and some elderly and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

## Minerals - Lead & Copper

Studies cited by the EPA show that ingesting lead or copper can cause health problems, especially in preg-

nant women and young children. Lead and copper found in drinking water usually comes from home plumbing. Some homes have higher levels than other homes. Water with a low pH can cause copper from copper pipes and lead from the solder (used to connect the pipes), to dissolve directly from pipes into the drinking water. Lead-based solder was banned in 1986, but small amounts of lead can still be found in many brass-plumbing fixtures and can slowly dissolve into water that has been left standing in pipes for longer periods of time.

Federal and state drinking water rules establish "action levels" allowable for lead and copper in water samples collected from homes. At least 90 percent of samples may have no more than 0.015 milligrams of lead in one liter of water and no more than 1.3 milligrams of copper per liter. Once every three years, we sample 5 (five) homes for lead and copper. The most recent sampling was completed in 2020 (see the lead and copper results for 2020 in the Water Quality Analytical Results chart on page 8). Results show our system at or below the action levels for both lead and copper. The next required scheduled monitoring will be completed in 2023.

Pregnant women and young children can be more vulnerable to lead

in drinking water than the general population. If you have concerns about lead levels in the water at your home, have your water tested. Running water between 30 seconds and 2 minutes after it sits stagnant in the pipes for a few hours can help clean the tap and reduce the amount of lead and/or copper in your water. A change in the temperature of water will also tell you when fresh water arrives. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline (1-800-426-4791) or at <http://www.epa.gov/safewater/lead>.

## Water Quality Improvements

Active mixing devices have been installed in some of the District's storage facilities to improve water quality, eliminate stratification, reduce water age, and provide equalization of free chlorine. Proper mixing will minimize taste and odor issues and help reduce the formation of disinfection by-products (DBPs). The need for additional mixing devices is being evaluated via the District's capital improvement program.

## DRINKING WATER CONTAMINANTS INFORMATION

All sources of water contain some amount of contaminants, including bottled water. In general, the sources for both tap and bottled water include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over land or percolates through the ground, it dissolves naturally-occurring minerals and in some cases radioactive material. The water can also pick up substances resulting from the presence of animals and/or from human activity.

Contaminants that may be present in source water include:

**Microbial contaminants**, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.

**Inorganic contaminants**, such as salts and metals, which can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming. Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.

**Organic chemical contaminants**, including synthetic and volatile organic chemicals, which are byproducts of industrial processes and petroleum production and can also come from gas stations, urban stormwater runoff, and septic systems.

**Radioactive contaminants**, which can be naturally-occurring or be the result of oil and gas production and mining activities.

# HOW DO WE TREAT YOUR WATER?

## Chlorine (Sodium Hypochlorite)

The District treats all ground water sources with the addition of chlorine (sodium hypochlorite) to protect against microorganisms which can cause illnesses such as typhoid, cholera, hepatitis and giardiasis.

This chlorination process is completed at the source where chlorine levels are monitored around the clock. Free chlorine residuals are also monitored throughout the water system 24/7. Chlorine is added to our water supply to act as an oxidant that destroys microorganisms in order to help maintain your health and safety. Chlorine also reacts with natural organic material commonly found in surface water sources such as the Regional Water Supply System (RWSS). This reaction forms compounds called disinfection byproducts (DBPs). The District meets drinking water standards for two groups of disinfection byproduct compounds. Byproduct levels found in water depend primarily on:

- The amount of natural organic material in the water.
- The amount of chlorine used to treat the water.
- The amount of time it takes water to reach the customer.
- The temperature of the water.

# WHAT'S IN YOUR WATER?

The results in the following table show the substances identified at the water source, at the treatment plant, and in the distribution system in 2021. The table does not include other volatile organic chemicals and synthetic organic chemicals that were tested for but not detected in our drinking water, including many industrial chemicals, herbicides and pesticides.

Scan Here to learn more about chlorine and drinking water standards

# WATER QUALITY ANALYTICAL RESULTS

CWD Sugarloaf System Water Quality Table 2021							
Regulated Substances	Unit	Year Sampled	MCL (Maximum amount allowed)	MCLG (Ideal amount or less)	Range or level Detected or # Exceed AL	Regulation Met	Potential Sources of Contaminant
Regulated at the Source							
Nitrate	ppm	2021	10 ppm	10 ppm	1.79 ppm	YES	Natural erosion
Regulated in the Distribution System							
Chlorine	ppm	2021	MRDL = 4 ppm	NA	0.42-1.10 ppm	YES	Treatment additive
Total Coliforms	%	2021	5.0% of samples per month	0	0	YES	Coliforms are naturally present in the environment
Haloacetic Acids (HAA's)	ppb	2020	60 ppb	NA	1.26 ppb	YES	Disinfection interaction
Total Trihalomethanes (TTHM's)	ppb	2020	80 ppb	NA	2.06 ppb	YES	Disinfection interaction
Regulated at the Customer's Tap							
Lead	ppb	2020	AL = 15 ppb	0	0 ppb	YES	Household plumbing
Copper	ppm	2020	AL = 1.3 ppm	1.3 ppm	0.971 ppm	YES	Household plumbing

## Acronyms

**NA:** Not Applicable

**ND:** Not Detected

**NTU:** Nephelometric Turbidity Units, measure of the clarity, or turbidity, of water.

**ppm:** Parts per million, or milligrams per liter (mg/L)

**ppb:** Parts per billion, or micrograms per liter (µg/L)

## Definitions

**Maximum Contaminant Level Goal or MCLG:** The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

**Maximum Contaminant Level or MCL:** The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

**Action Level(AL):** The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.

**Treatment Technique (TT):** A required process intended to reduce the level of a contaminant in drinking water.

**Maximum Residual Disinfectant Level (MRDL):** The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

**Maximum Residual Disinfectant Level Goal (MRDLG):** The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

## WHERE YOU CAN GET ADDITIONAL INFORMATION

Covington Water District
